The CSS resolution is used for measurements in the CSS Rules, and the Screen Device Resolution is the actual number of pixels on the screen. Besides the two resolution types, ...

Understanding the Difference Between CSS Resolution and ...

.text { font-size: 14px; } @media (max-width: 480px) { .text { font-size: 16px; } } Normally, the text size will be 14px. However since we applied a media query, it will change to 16px when a device has a maximum width of 480px or less. Important: Always put your media queries at the end of your CSS file. Media Types

Media Query CSS Tutorial – Standard Resolutions, CSS ...

CSS doesn't define what "high resolution" means. But as low-end printers nowadays start at 300 dpi and high-end screens are at 200 dpi, the cut-off is probably somewhere in between. There is another reason to avoid absolute units for other uses than print: You look at different screens from different distances.

CSS: em, px, pt, cm, in…

In the example above, any styling inside the media query would kick in if the screen is at least 800px wide. (I wouldn't load different CSS files depending on the screen size, btw.) Finally, since you used the word "resolution", I feel I must add that you can set the media queries to match screen resolutions, too.

CSS Compressor

In CSS media the difference between width and device-width can be a bit muddled, so lets expound on that a bit. device-width refers to the width of the device itself, in other words, the screen resolution of the device. Lets say your screen's resolution is 1440 x 900. This means the screen is 1440 pixels across, so it has a device-width of 1440px.

CSS media queries: width versus device-width

The image-set() function allows an author to ignore most of these issues, simply providing multiple resolutions of an image and letting the UA decide which is most appropriate in a given situation. There is no perfect 1:1 replacement for srcset in CSS, but this is pretty close. sizes in CSS. The sizes attribute in HTML is very directly related ...
