The dam is a zoned, 425 ft. high, earthfill structure consisting of a central dam core, flanking transition zones and sluiced rock shells. Elevation at the top of the dam (pre-contract) is 1250, with a flanking concrete chute spillway (crest El. 1215) on the right abutment (Plate 2). Normal riverflow

is

Mud Mountain Dam Seepage Control Cutoff Wall

Since first usage in the 19th century, grouting has been performed on the foundation of virtually every one of the world's large dams, in order to reduce the amount of leakage through the rock, and sometimes to strengthen the foundation to support the weight of the overlying structure, be it of concrete, earth, or rock fill.

Pressure grouting - Wikipedia

The foundation treatment of Glen Canyon Dam consists of three parts: Grouting, drainage, and excavation of cutoff drifts and backfilling them with concrete. The cutoff drifts and the grouting will seal the cracks and joints. The drainage hole pattern will relieve the water that may seep through the massive sandstone. 13.

CHAPTER 111. FOUNDATION TREATMENT

Both curtain and consolidation grouting of the dam foundation were performed. Grout takes were generally low, except for a few isolated zones high in the abutments. No drains were drilled from the dam foundation gallery during construction, which is a common practice for thin arch dams. Dam monitoring for the first 20 years
