Separation of the variable is done when the differential equation can be written in the form of $dy/dx = f(y)g(x)$ where f is the function of y only and g is the function of x only. Taking an initial condition, rewrite this problem as $1/f(y)dy = g(x)dx$ and then integrate on both sides. Also, check: Solve Separable Differential Equations Integrating factor technique is used when the differential ...

Differential Equations. A Differential Equation is a n equation with a function and one or more of its derivatives:.. Example: an equation with the function y and its derivative $dy dx$. Solving. We solve it when we discover the function y (or set of functions y).. There are many "tricks" to solving Differential Equations (if they can be solved!).But first: why?

Such equations are hard to solve. So we will be looking at second order linear differential equations, which have the form $y'' + p(t)y' + q(t)y = g(t)$. (1.2.2) If a second order equation can be written in the form of the above equation, it is called linear, and otherwise nonlinear. For such differential equations solving methods exist.

Sometimes there is no analytical solution to a first-order differential equation and a numerical solution must be sought. The first-order differential equation $dy/dx = f(x,y)$ with initial condition $y(x_0) = y_0$ provides the slope $f(x_0,y_0)$ of the tangent line to the solution curve $y = y(x)$ at the point (x_0,y_0) .

In this paper, we prove the results on existence and uniqueness of the maximal solutions for measure differential equations, considering more general conditions on functions f and g by using the correspondence between the solutions of these equations and the solutions of generalized ODEs. Moreover, we prove these results for the dynamic equations on time scales, using the correspondence ...
