Water erosion and surface water runoff are problematic. One of the main causes of soil erosion is water erosion, which is the loss of topsoil due to water. Removal of vegetation is another cause of soil erosion and so is the removal of keystone species such as elephants from an area, when they are unable to fulfill their niche in the local ecology.

Humans can mix the soil so extensively that the soil material is again considered parent material. The native vegetation depends on climate, topography, and biological factors, plus many soil factors such as soil density, depth, chemistry, temperature, and moisture. Leaves from plants fall to the surface and decompose on the soil.

An earthworm is a terrestrial invertebrate that belongs to the phylum Annelida. They exhibit a tube-within-a-tube body plan; they are externally segmented with corresponding internal segmentation; and they usually have setae on all segments. They occur worldwide where soil, water, and temperature allow. Earthworms are commonly found in soil, eating a wide variety of organic matter.
